Case Overview Graph

Insufficient connected transactions to render this graph for this run.

This exhibit summarizes reconstructed case clusters only: each node is a cluster with its risk level and account/edge counts, while detailed account links are shown separately for the highest-risk clusters.

Account Interconnection Graph

Insufficient connected transactions to render this graph for this run.

This static exhibit is filtered for legibility: it shows the material account-to-account relationships and only the most evidential external counterparties, while the full-density network remains available in the UI graph data.

Suspicious Activity Timeline

The graph shows a timeline of suspicious activity from 2021-02-17 to 2025-10-01, covering a total of 4165 transactions. The most notable figure is the total number of transactions, which is 4165. An investigator should take note of the large number of transactions over the approximately 4-year time span, with no transactions being flagged or excluded.

Fraud-Pattern Summary

The graph shows a summary of fraud patterns with the most notable figure being 20 instances of Structuring Smurfing Detection, followed by 19 instances of Money Trail Tracing. An investigator should take note of these large figures, as well as the 6 instances of Credit To Cash Out Chains and 4 instances each of Duplicate Verification, Round Value Debit Patterns, and Suspicious Account Ranking. The time span and largest transfers are not explicitly stated in the provided data, but the busiest patterns are clearly related to money structuring and trail tracing.

What stays on this machine

- All fraud detection, scoring and ranking run on this machine (deterministic code).
- Raw bank statements and extracted transactions never leave the machine.
- The money-flow graph, clusters and suspicion scores are computed locally.

What is sent to an external service

- Only small, redacted text samples are sent to the language model to describe a statement's column layout when local parsing is insufficient.
- For images / scanned PDFs, the page pixels are sent to a vision model (the one unavoidable case).
- The language model only rewrites explanations into plain language; it never changes a number, account, or decision.
