5 · Money-Flow Graphs

Case Overview Graph

Insufficient connected transactions to render this graph for this run.

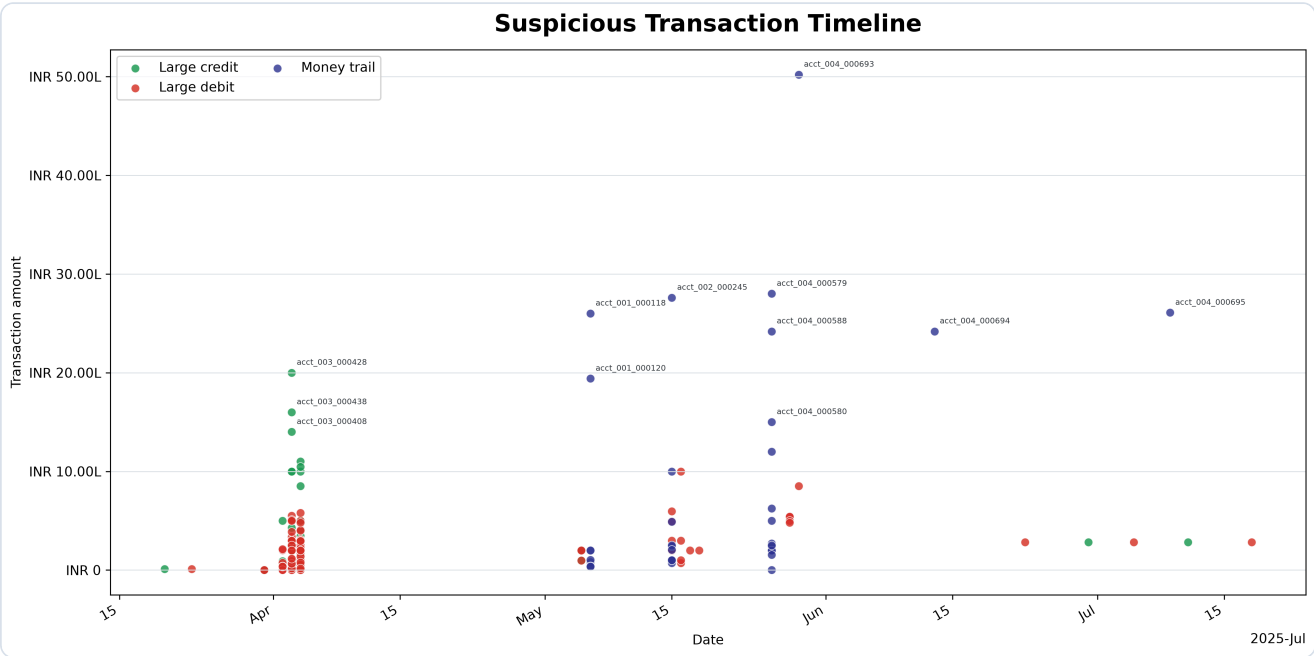

This exhibit summarizes reconstructed case clusters only: each node is a cluster with its risk level and account/edge counts, while detailed account links are shown separately for the highest-risk clusters.

Account Interconnection Graph

Insufficient connected transactions to render this graph for this run.

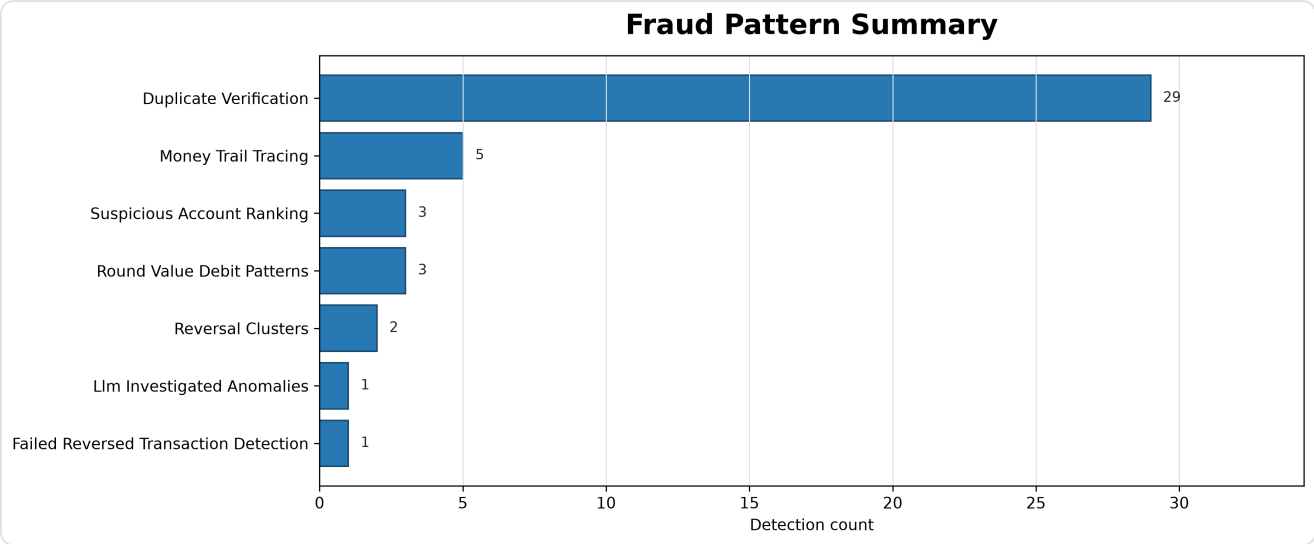

This static exhibit is filtered for legibility: it shows the material account-to-account relationships and only the most evidential external counterparties, while the full-density network remains available in the UI graph data.

Suspicious Activity Timeline

The graph shows 672 transactions over a period from 2025-03-20 to 2025-07-18. The most notable figure is the total number of transactions, which is 672. An investigator should take note that there are no flagged transactions excluded from the graph, indicated by 0 flagged_excluded.

Fraud-Pattern Summary

The graph shows various fraud patterns, with the most notable being Duplicate Verification, which occurred 29 times. The busiest pattern is Duplicate Verification, while other patterns like Failed Reversed Transaction Detection and Llm Investigated Anomalies occurred only 1 time. An investigator should take note of the high frequency of Duplicate Verification. The data includes 45 total pattern counts across 8 different types.

Data Security & Method (Appendix)

What stays on this machine

- All fraud detection, scoring and ranking run on this machine (deterministic code).
- Raw bank statements and extracted transactions never leave the machine.

- The money-flow graph, clusters and suspicion scores are computed locally.

What is sent to an external service

- Only small, redacted text samples are sent to the language model to describe a statement's column layout when local parsing is insufficient.
- For images / scanned PDFs, the page pixels are sent to a vision model (the one unavoidable case).
- The language model only rewrites explanations into plain language; it never changes a number, account, or decision.

Language-model calls this run: 15 · partial_failure
