Case Overview Graph

Case Overview Graph

Each node is a reconstructed case cluster. Detailed account-level graphs are generated only for the highest-risk clusters.

The graph shows 2 clusters, with cluster_001 being the most notable, containing 87 accounts and 7120 edges, and having a total score of 22291.0949. Cluster_001 also exhibits the most patterns, with 17 different pattern_ids. An investigator should take note of the significant difference in activity between cluster_001 and cluster_002, which has only 1 account and 0 edges. The time span and largest transfers are not explicitly stated in the data.

Account Interconnection Graph

This static exhibit is filtered for legibility: it shows the material account-to-account relationships and only the most evidential external counterparties, while the full-density network remains available in the UI graph data.

Suspicious Activity Timeline

The graph shows a timeline of suspicious activity from 2018-01-06 to 2025-12-31, covering 22671 transactions. The most notable figure is the total number of transactions, with 5 flagged and excluded. An investigator should take note of the large number of transactions over the nearly 8-year time span. The high volume of transactions may indicate a pattern worth further investigation.

Fraud-Pattern Summary

The graph shows various fraud patterns with 'Duplicate Verification' being the most frequent at 744 occurrences, followed by 'Shared Upi Identifiers' at 143, and 'Money Trail Tracing' at 100. An investigator should note the high frequency of 'Duplicate Verification' and 'Shared Upi Identifiers' as potential indicators of fraudulent activity. The presence of 72 'Low Value Account Testing' instances and 14 'Suspicious Account Ranking' instances also warrants further investigation.

Data Security & Method (Appendix)

What stays on this machine

- All fraud detection, scoring and ranking run on this machine (deterministic code).
- Raw bank statements and extracted transactions never leave the machine.
- The money-flow graph, clusters and suspicion scores are computed locally.

What is sent to an external service

- Only small, redacted text samples are sent to the language model to describe a statement's column layout when local parsing is insufficient.
- For images / scanned PDFs, the page pixels are sent to a vision model (the one unavoidable case).
- The language model only rewrites explanations into plain language; it never changes a number, account, or decision.

Language-model calls this run: 25 · partial_failure
