Account Interconnection Graph

This static exhibit is filtered for legibility: it shows the material account-to-account relationships and only the most evidential external counterparties, while the full-density network remains available in the UI graph data.

Suspicious Activity Timeline

The graph shows 1338 transactions over a period from 2019-11-26 to 2025-10-03, with 12 transactions flagged and excluded. The most notable figure is the total number of transactions, indicating a high volume of activity. An investigator should take note of the time span, approximately 5 years and 11 months, to understand the scope of the suspicious activity.

Fraud-Pattern Summary

The graph shows various fraud patterns with the most notable being Duplicate Verification with 142 occurrences. The busiest pattern is Duplicate Verification, which stands out significantly from other patterns such as Failed Reversed Transaction Detection with 1 occurrence. An investigator should take note of the high frequency of Duplicate Verification and the relatively low counts of other patterns like Structuring Smurfing Detection with 9 occurrences and Money Trail Tracing with 18 occurrences.

Data Security & Method (Appendix)

What stays on this machine

- All fraud detection, scoring and ranking run on this machine (deterministic code).
- Raw bank statements and extracted transactions never leave the machine.
- The money-flow graph, clusters and suspicion scores are computed locally.

What is sent to an external service

- Only small, redacted text samples are sent to the language model to describe a statement's column layout when local parsing is insufficient.
- For images / scanned PDFs, the page pixels are sent to a vision model (the one unavoidable case).
- The language model only rewrites explanations into plain language; it never changes a number, account, or decision.

Language-model calls this run: 15 · partial_failure
